

# 2020 LOGOLOUNGE TREND REPORT

BILL GARDNER

As with every logo trend report I write, I look to the past before looking ahead. You can't tell where something is going if you don't know where it's been. There's always a reason something goes viral or takes off—something set it in motion, good or bad. So let's start by addressing the white elephant on the planet: COVID-19.

Crises often accelerate trends in society and design. It's very reactive and rushed—i.e. if there were a ten-step program that we typically follow to get from point A to point B, we skipped steps six through nine to get there during a crisis. Next year, we're probably going to see a lot of logos that came as a result—some will be brilliant, while many more probably won't. No matter what, I believe the design industry is going to come out of this better than we were. Some firms will not recover. It's going to be survival of the fittest, but having said that, we'll see an emergence of little start-ups and uncover some talent we've never seen before. People will regroup, find their niche and come out of this with a new resilience.

We're going to see a new way of working and doing business. While working remotely, we've also come together and grown closer with a new kind of face-to-face—something we probably weren't doing anyway. Just because people work in close proximity, doesn't mean they're connecting or talking. Zoom and Facetime have become the new norm in business as companies work with offsite pods of people with different skillsets. We're talking to each other more now than before.

Another offshoot of this, is that we're seeing the big telecom and technology companies step up and lead, offering expanded services to help students with e-learning, keep remote workers working and provide more entertainment options than ever before. Sometimes the price of doing business means being a good citizen.

This is a shared generational experience that we'll never forget and hopefully, we'll all learn from. Next year's batch of logos will surely reflect this!

As for this year's trends, we're seeing some intriguing clusters of design innovation driven by technology and tools. For instance, there are a lot of logos this year that employ variable fonts and effects filters, maybe for no other reason than we have the capabilities to do it. As designers, when new tools are introduced, we start with the obvious effects and objectify the coolness (which gets tired after a while). Fortunately, there were many great examples by designers who took these tools to the next level, exploiting their capabilities and creating new logo experiences that we've never seen before.

We're also seeing two opposite trends that harken back to the best of the 1970s. Wordmarks with big fat fonts came out roaring this year (think bell bottoms and afros), perhaps as a counter to the minimalist sans serif aesthetic we've gotten used to the last five or six years. At the same time, there are a lot of ultra-minimalist vector images with clean positive/negative fields that may have resulted from a desire to return to clarity and simplicity, ala Saul Bass and Paul Rand—the pendulum swings both ways.

There's also a tendency toward minimalist effects using transparencies, where one surface hovers closely to another. It's getting tiresome and I see a movement away from this. On the other hand, we have what I like to call "Potter Pics," which reference the little animated movements in some logos, like the wink of an eye. They're subtle and clever.

Hand-drawn naïve symbols that are more crude are emerging. They're kind of a New Age throwback. In a similar vein, there are logos with flowers and leaves referencing organics and natural products. Expect to see more of this as the cannabis market expands in the next few years.

Bolts and Twinkles have reached a place of critical mass this year and they are far-reaching. The mystical and lighthearted applications have a level of charm that can be seen in conservative business to business brands as well as little boutiques—ie They are equally at home in the boardroom as they are on the boardwalk, and that's not something you can say about a lot of things!

Gradient solutions are rampant, but it's taken on a new level and being applied in novel ways. The simple ways of washing green to blue or red to orange are tired, so now there are more fashionable applications. For instance, there are waves of purple to pink, then zooming into a blackhole or interacting with colors that aren't necessarily adjacent to each other on the color wheel. It's quick and busy and interactive.

And, of course, in the opposite corner there is a trend toward intricate linework that is so fine it's taking on a halftone effect by default when it's scaled down.

Things that have gone rampant include kettle weights, anvils, Legos and animals like foxes and tigers—but not Tiger Kings. Wait 'til next year! There are also a lot of logos with a third eye thrown in. The third eye is supposed to indicate self-actualization, but I don't think that was taken into consideration so much on a lot of these. It just felt like a weird element that was added as an after-thought.

I never grow tired of reviewing the thousands of logos we receive every year. It's always a fascinating study of creativity and innovation. These trends come and go and then come back again. I'm grateful to the logo design community for bringing their best to LogoLounge each year.

This report is an observation on the logo industry and isn't meant as a guide for best practices. Trends are trajectories that will evolve and modify over time, not a passing fad. Use the ideas here to push your design skills to the next level and keep the trajectory moving to the next iteration.

## COUNTERS

There are more than enough idioms in our language that lambast the individual that can't spot the obvious: They can't see the forest for the trees; Couldn't see it if it hit you; Hidden in plain sight; or a personal favorite, Can't see a hole in a ladder. Though questioning a designer's perspective can be treacherous, their personal use of these phrases is less an insult to the viewer than an attempt to brag. They themselves have seen the obvious and if you were equally as smart you'd see it too. These logos are less about the colorfully arranged elements floating on the background but more about the negative counter space created between them.

There's no better way to endear the public to a mark than to build margin in the design for them to participate. Recognizing the consumer's intelligence and leaving room for discovery and the aha moment in these logos allow them to live on multiple levels. A tread forms an S, as well as a pair of arrows intersecting where diverse content joins together. A series of parallelograms represent structures with a sunset gradient on the horizon crafting a mnemonic reminder of the letter H. These marks tend to work best when simple and relatively geometric in construction. ... But who can't see that?

## MAZES

Mazes and their inception have always puzzled me. In classical times, I can imagine them being laid out and pruned within an inch of their life to amuse the owner of some well-healed estate. On the other hand, I can see that they could have been a way for the elite to dispose of boorish guests that had tested their limits.

Whether you look at a maze as a delight, a mystery, or a punishment it is a challenge that visually represents many of the objectives a client may wish to associate with their brand. As a rule these marks are a continuation of the monoline aesthetic with an even distribution of positive and negative weight.

Some of these marks identify a path that enters at point A and exits at point B, while others guide you directly into a blind dead end or a goal or starting point, depending on the perspective. Either way there is a specific pathway that leads you to a timely completion of your task. Having a guide for the journey that might otherwise be interminable is the underlying promise these marks address. As addictive as click bait, they invite a consumer to visually trace their route, demonstrating it's much easier to find your way to freedom with a birds eye-perspective of the challenge.

## SISTERS

Humans have a desire to achieve a level of balance and harmony. We like to create order. As a rule, order can give us a sense of wellbeing. This is all part of a much bigger psychological conversation associated with the Gestalt theory, but for the purpose of this trend it's driven by our comfort with symmetry. This group of logos are most often crafted from two identical elements either mirrored or rotationally nestled together after a 180-degree rotation.

It's not uncommon for the end product to assume the shape of a letterform or be constructed by reflective letters. The symmetry of these logos creates a sense of assurance in much the same way you find harmony in a yin yang symbol. It conveys the idea of a strong partnership that is well suited and beneficial to both sides. Rotational pairings can easily represent a sense of motion or action that may demonstrate a positive aspect of the client's nature. Like the siblings this trend is named for, the two distinct elements may be in perfect harmony or reference co-joined elements rife with tension. Regardless they will work it out. After all, they are family.

## CHEXMELT

Sometimes an aesthetic meets its demise and no one remembered to tell it. A bit like my feelings for designs that trod out the old circuit board solder pathways careening around like a pair of Tron cycles abruptly flaring out to terminate in a silver dot cul-de-sac. That technology probably took us to the moon and back, but for designers it provided an immediate visual language we relied on and abused right up 'til the night we met pixels. Now in some karmic incarnation, the two trends bore an offspring with a perfect 50/50 genetic split.

Samsung committed to this trend with their Exynos mobile processor using a mark laid out like a pixel chessboard that softly melts together with a soldered bridge at every corner. Walk away from these marks without a sense of tech and you probably forgot to look. The checkered framework of these logos demonstrate an affinity for building linkage and pathways between entities. They express the idea of multiple elements coming together to create a greater good, but corner-connecting just enough to maintain modest autonomy all the while keeping their social distance in check.

## BEVEL TIPS

Each trend report manages to identify a shape or two that rapidly populate every designer's kit of parts like words that enter the news cycle based on a sheet of talking points. Every pundit uses the phrase like it spontaneously leapt to their lips, and every designer uses the shape of the hour with the same impromptu reflex. The best I can do to identify the cause of this eruption is to look at the previous year's trends and designers' affinity for the use of canted parallelograms. Those previous shapes strongly resemble this year's crop, but these shapes have approachable, organic curves.

For each rounded bend there is a counter corner that draws to a point like the tip of a leaf. No surprise that this shape has found its home in a number of marks that are eco-centric and hope to reflect the language of nature's building blocks. Foliage, feathers, grain, cresting waves or any number of other receptive contoured forms. This shape stacks, reconfigures and pairs well with other soft shapes or blends with harsher geometrics to soften their effect. It serves as a refreshing addition on a number of stiff sans serif fonts, to add a wisp of nature and whimsy.

## PETRI DISH

I've always thought of a petri dish as a fully contained eco-system that investigates bacteria and other phenomenon. Those clear dishes serve as our little round window into discovery of the unknown, while sealed to protect us from their content. Exactly like these logos. These micro views of a macro world are tightly cropped shots, often framed in a simple circle or square. That cropping purposefully focuses the consumer on just enough detail to extrapolate the rest of the story.

Swimming in these pools are right angles, arcs, points and curves—just enough to telegraph the actual contents as circles, squares, stars or whatever the visual totem happens to be. This places faith in the public's participation and their deductive skills at ferreting out the intended message. Dana-Farber captures the arc of a D and the right angle of an F coming together to form a human with a focused venn diagram at the intersection. Investissement Quebec crops in on its proprietary Q just enough to show a profit chart with a sweeping upward trend. You have to appreciate an entity that avoids pure literal solutions in favor of placing faith in our ability to attain our own aha moment.

## VARIABLE TYPE

When evaluating the lift-off thrust of any trend, success is often measured between the born-on date and the rise to critical mass. If momentum doesn't build, you're doomed. On the other hand, popular trends tend to burn out overnight. We find variable type on a strong pace to have an influence on logo trends for some years once we figure out how to drive them. Just this last year, more designers embraced the basic bag of tricks generally reserved for demonstrating variable type capabilities. Diminishing or contorting type in a sequence of thick to thins or squat to tall, and even animating it as such, are eye candy but probably not the use the original developers of variable type had in mind. In fairness, these fonts weren't created just for logo designers, but we tend to gladly appropriate shiny things.

Unfortunately, the only time variable type can be identified as such is when it's shown in contrast or motion. Amsteldok, the WPP offices in Amsterdam, have really done an astonishing job of embracing regional and historic influence for their proprietary font, and have used the variable capabilities to create a highly flexible system. That system manages to hold together admirably, but also is designed to morph and gyrate. It works without appearing to be a slavish demonstration model.

## BLACKLETTER

Hard to throw too much shade at a font that was Europe's only choice from the 12th to the 17th century. Blackletter fonts never completely vanished and became the preferred text for Germany, which probably explains its recent resurgence with the vast array of microbrew pubs dotting corners across the globe. It's never truly been out of mind, serving as the font of choice for nameplates on hundreds of newspapers worldwide. It even worked pretty well on your diploma and for Disneyland, but how did it make the jump to AC/DC and Snoopy Dog? Now that's some kind of flexibility!

Though it's no friend of legibility, it will never be accused of lacking personality. That may be the reason it's on every designer's casting call as we investigate counter measures to the blandification of wordmarks crafted from soulless sans serif sameness. The slab and angled strokes have a sharp graphic appeal that allow for abundant customization and retooling. Plenty of Blackletter inspired fonts are popping up with a myriad of weights, in-lines, swashes, ornaments and other iterations. It's a perfect mouthpiece for demonstrating a client's heritage, and craftsmanship and expresses both with inspired drama.

## iDROPS

I like to imagine the conversations that take place in designer presentations I'm not privy to. After you've worked with enough clients you start to recognize some of the signs of client fatigue that lead a designer to give in on this thing or that. I picture the designer whose work has been stripped down to a company name in a lowercase bold sans serif. Dejected and brow beaten after numerous attempts to interject some color or life, the client finally concedes a spot of color on the dot. Of course, this is pure conjecture, not having seen the actual design briefs for said projects.

After seeing too many solutions like Dimple or Medallia using the color dotted i only, I have tried to show a broader range of applications under this umbrella that demonstrate some of the stronger conceptual thinking. Admittedly the lower case i is often cast as the person in the letterform with the dot serving as the head. Often a few extra colored dots on letters that don't really call for one, help describe the family or a team. Uplight flopped their i and lit their bottom, while Mitto is just burning its i at both ends. Clever.

## HANDOUT

Take a look at this beautiful array of hands that are abundant this year. Dramatically different in illustration style, and beyond the hands themselves, there's one distinct commonality: They all have something either hovering above them or we captured these elements in free fall. This may be symbolic of the magical essence of the relationship between the product and the user. Grant it, the bird has reason to hover but there is some kinda special levitation going on when a bottle not only rises out of the hand but GLOWS!

When a hand appears as part of a logo, it's often to represent a human experience that's part of the brand assurance. I think these demonstrate a receptive attitude with palms up, open and at ease. These hands impart a new-age culture and are likely to be accepted in an artisan boutique or definitely in a business to consumer category. Handcrafted products seem to fit this genre, but more likely these are associated with an experience with an extraordinary promise. These marks tell enchanting stories and ask the consumer to both suspend belief and to believe at the very same time.

## BOLTS

A symbol is only a representation of a thing or concept. We know a human heart looks nothing like the symbol we use to represent it. Nor does a star, or fire or a cloud. The ancient Greeks used a symbol for lightning that looks nothing like our modern-day interpretation. And our interpretation, looks nothing like the real thing. Even so, it was in abundant supply in this year's crop of logos.

For millenniums, lightning was almost exclusively looked at as a weapon or punishment from the gods. They were in charge of it and could release it at will. We'd not really fathomed the idea of electricity so it's not surprising that the idea of a bolt representing energy, illumination or a flash of brilliance is only a recent association. The Top Hat design used lightning as a small detail that's a universal representation of action. I like to think that these phenomenon represent an inexplicably awesome event. Stick around and it may happen again.

## TWINKLE

Those that follow this report annually may recall a few years back we identified the expanded use of four-pointed stars to which we assigned the name Sparkle. At the time, this group was fledgling, but typically appeared as a non-aligned star avoiding jingoistic or religious connotations with more points. Four points was enough to get the idea across with minimal detail making it ideal for logo design. Much like many of the logos from those “Sparkle” stars were primarily used in a space-filler mode to add some magical charm to an illustrative mark with a capricious attitude.

We evolve and so do the trends. That planting of seeds a few years back not only sprouted a healthy set of legs this year, it’s grown into an Olympic sprinter. Lemman Jewelry laid claim for the center stroke on their letter E, where every stone has that glint. This trend has pressed forward to the obvious, which is creating a star as the negative space at the convergence of four curves. For a client, this builds a good story of coming together to create a brilliant solution or a star from many. Remove any one of the pieces and the achievement vanishes.

## CORNERED

As designers, I cheer on any of our ilk that creates a product so engaging that the public becomes inextricably involved in it. I mean isn’t that one of our ultimate goals—to captivate the public and create a symbol that can’t be ignored? Optical illusions often do that as do single perspective murals that shift appearance with our vantage point. We’re readily mesmerized by the sidewalk artist that create such illusions as making it appear there’s a waterfall or a gaping canyon in the middle of a plaza that’s no more than a deceptively realistic rendering.

I believe designers understand that there are many triggers for consumer engagement and deceptive dimension is one of them. Anytime we can extend that mental participation in what we design for our clients, we are creating neural links with their brand. We refer to these as “Cornered” because each has manufactured the illusion of space by wrapping their design around an artificial reality. These all reside on a flat plain of white that gives no hint of dimension, but that can serve as the perfect canvas for these to dimensionally exist in undefined space.

## LETTER ILLUSIONS

There are those things in life that can make us feel uncomfortable or on edge, but that captivate us nonetheless. It's the old theory of a train wreck and not being able to look away. We may fain an objecting posture, but inside we want to take it in, secretly wishing we could stare at the scene like we'd paid full price at the freak show to watch the contortionist writhe. Feeding the public's mind with the unexpected or seemingly impossible is not just a way of creating disruption; it's also the way of communicating a promise, achieving the impossible or scouting a pathway to the unobtainable.

Virile strains of these marks have cropped up this cycle, with many using letterforms as a mnemonic reminder of the entities name. As if lifted from the pages of a book on optical illusions, these marks range from linear outlines like you'd find with DIY instructions, to the fully illustrated with gradients, shadows and spectral light pings. The use of graphic illusion is nothing new, but the abundance this year hints at a rediscovery of miraculous problem-solving skills and a unique perspective—or possibly the ability to teach your customers how to achieve the same. And when you can't quite explain a client's complicated process, laying claim to a little bit of magic is a great fall-back explanation

## CHISELED SHADOW

Demonstrating dimensionality of form is a foundational way of shifting a flat image from 2nd, to at least 3rd gear. Finding that hybrid between committing to gradient tone and graphic surfaces that imbue reality and a simple vector outline really only offers up a handful of tricks. Shadow has long been a staple of the designer to convey space in a flat graphic. They are less about the absence of light than they are about defining a light source. Harsh shadows on these marks can help to communicate a client's desire to be under the focus of a spotlight and open for complete inspection with nothing to hide.

What differentiate this group from other shadow marks are the 45-degree angular cuts that would ordinarily be cast if the surface it appears on is a separate plain angling away. This is modestly troublesome in trying to actually model the realism of the light conditions. I'm convinced these designs are less about crafting reality than they are about creating a dramatic fictional dimension, embellished by stark shadows with flexible rules. The mass appearance of this effect is mostly played out on sans serif letterforms and tends to hearken to the angled effect of a serif, excised from the letters in a chiseled dimensional form.

## The 2020 Logo Trend Report

2020 marks the 18th year of this one-of-a-kind report. Each year, it offers the opportunity to literally review thousands upon thousands of logos one at a time, looking for nuances and artifacts of emerging trends. As we acknowledge that each design represents hours and hours of thought and struggle from designers around the world, we are as humbled and awed as ever by their dedication to the craft and grateful for the important role they play in helping us create these reports. So thank you to all of the designers who have and will contribute to the Trend Reports then, now, and for years to come.

For an even deeper look at this year's trends, visit our course on LinkedIn Learning (formerly Lynda.com).

---

Bill Gardner is the president of Gardner Design and founder of LogoLounge.com, a repository site where, in real time, members can post their logo design work and search the works of others by keyword, designer's name, client type, and more. The site also offers news curated expressly for logo designers as well as unlimited entries for consideration in the bestselling LogoLounge book series. Bill can be contacted at [bill@logolounge.com](mailto:bill@logolounge.com).

---

LogoLounge.com is the most comprehensive and searchable database of logos available today. More than 300,000 logos have been submitted to the site since 2002, growing it to the largest online treasury of professionally designed logos. Through their submissions, members also gain the benefit of consideration for publication in the LogoLounge book series, the result of the most prestigious logo design competition in the world.

Through the line of LogoLounge books (currently published in volumes 1 through 11) designers can gain even more insights from a collection of the smartest logo designs submitted to LogoLounge from all over the world, which are hand-selected by a preeminent panel of some of the most respected names in the industry.

In 2016, LogoLounge took a giant step forward as it extended membership to the next generation of designers with LogoLounge Leap, which allows educators and students free or deeply discounted access to the site as well as online resources and educational tools.
